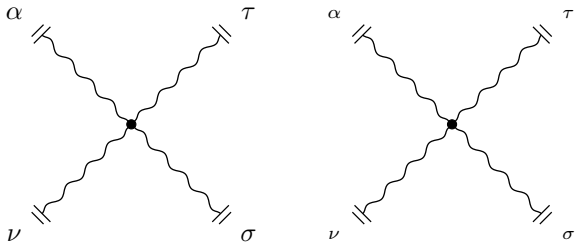
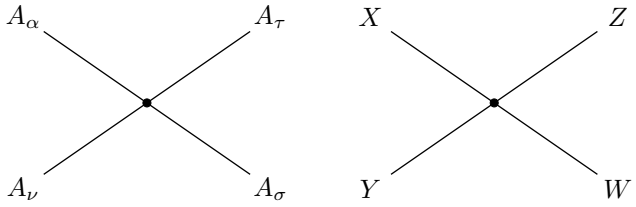
Mini external indices

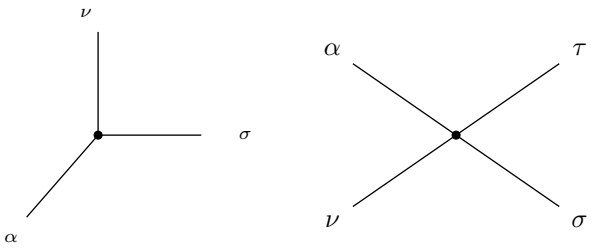
With an empty field, mini indices use an empty math base: ${}_{\alpha,\nu,\sigma,\tau}$. No horizontal spacer is required.

Normal labels (left), mini indices (right). Both run counterclockwise from the upper left: $\alpha, \nu, \sigma, \tau$.



With a field, mini retains ordinary field subscripts. Explicit leg labels override index formatting (right).





Mini formatting follows logical slots under rotation (left). The next diagram returns to normal empty-field labels (right).
