Crossed vertex: the two diagonal layouts

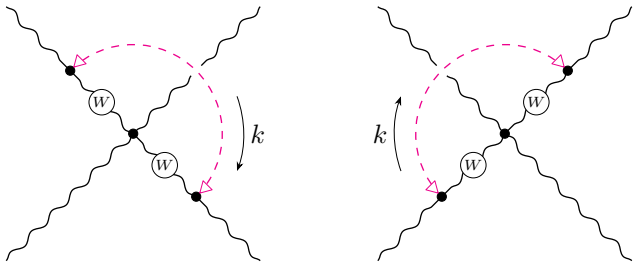

Plain lines, three interaction vertices. A continuous half-moon passes over one interrupted external leg; the crossing has no interaction dot.

`\CrossedVertexCorr[crossed-vertex-orientation=right/left]`
Internal slots: 5 = center to A, 6 = curved A to B, 7 = B to center. The two straight internal edges share a diagonal with the opposite outer corners.

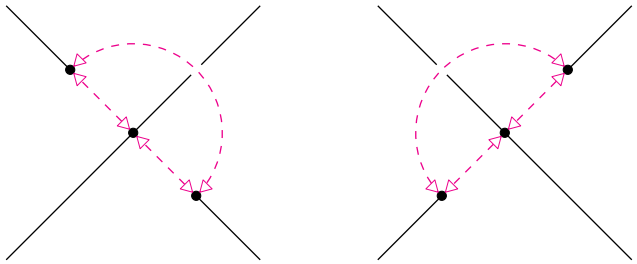

Styled references

EW external legs, W circles on the two collinear internal edges, pink Proca half-moon with two endpoint tips and only its k momentum guide. No caps.

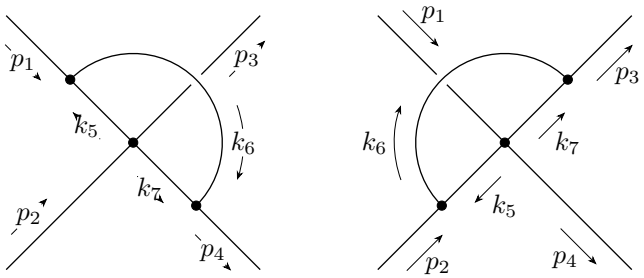

Semantic markers: all internal edges

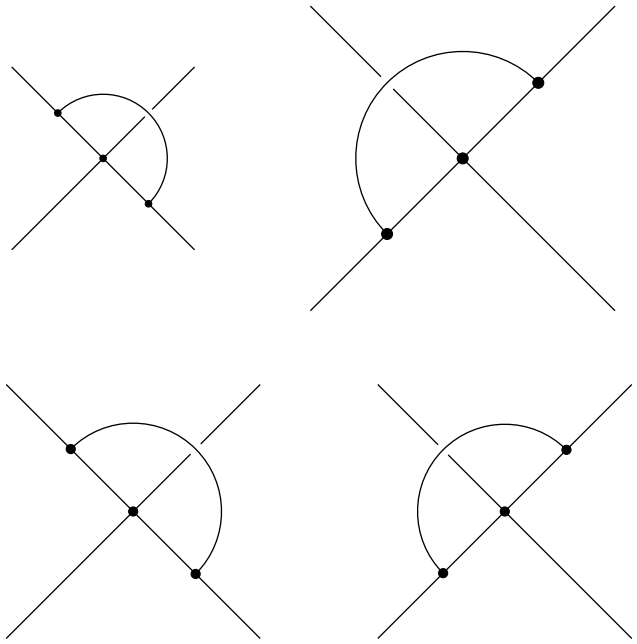

Minimal marker-contact checks: no circles, caps or momentum.

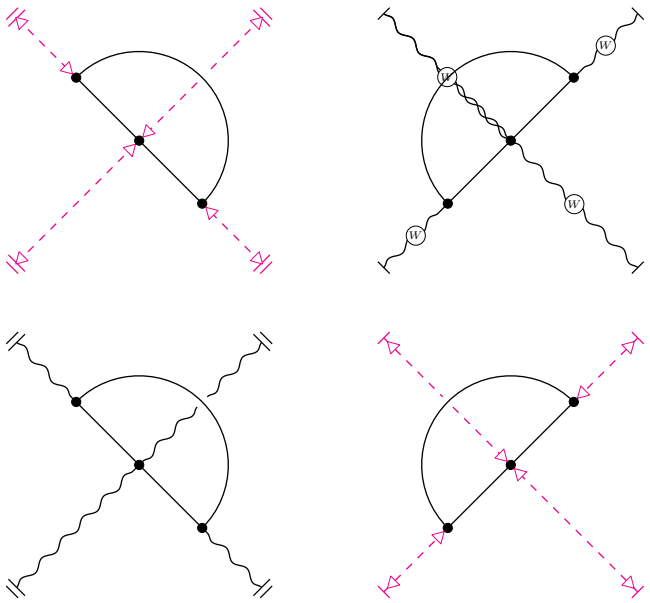

Independent momenta: gap and side

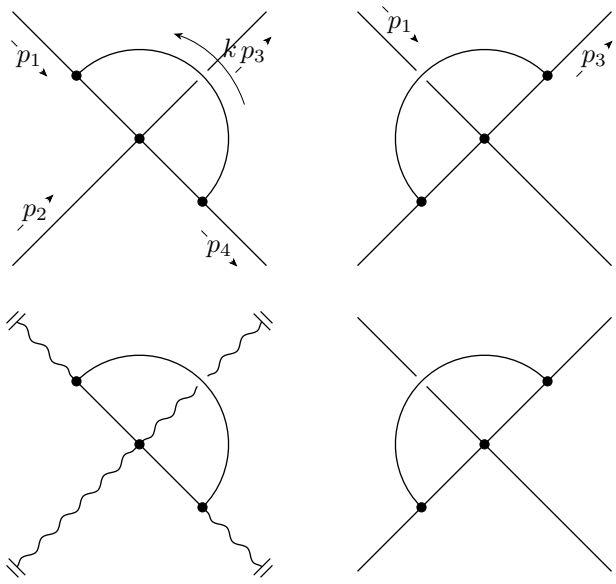

Scale and span overrides

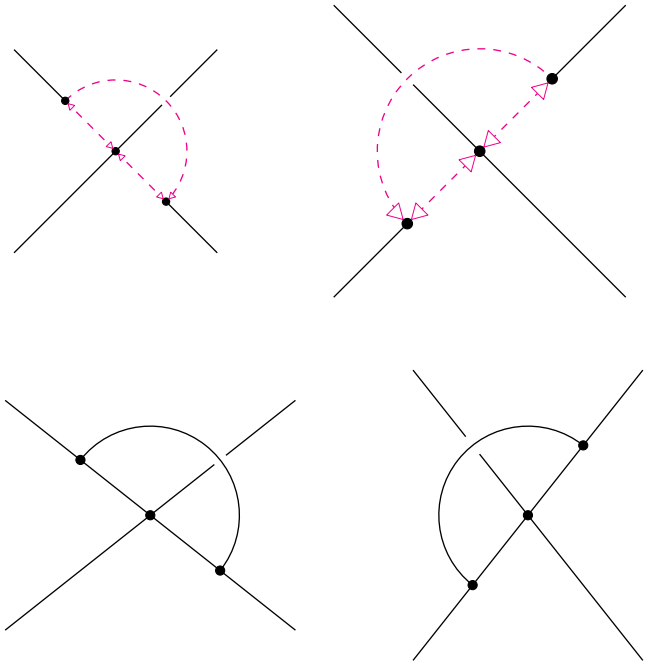

Full outer caps and split-leg styles

Reversal, slot controls and math alignments

One-ended tips, reversed arcs and unequal outer spans

Index attachment and consecutive-call reset

Index appearance remains the deferred D01 workflow. Slot 6 attaches to the actual curved edge, with the existing per-end anchor and shift controls.
